## **PRENYL TRANSFERASE INHIBITORS**

### **BACKGROUND OF THE INVENTION**

The Ras family of proteins are important in the signal transduction pathway modulating cell growth. The protein is produced in the ribosome, released into the cytosol, and post- translationally modified. The first Step in the series of post-translational modifications is the alkylation of Cys<sup>168</sup> with farnesyl or geranylgeranyl pyrophosphate in a reaction catalyzed by prenyl transferase enzymes such as farnesyl transferase and geranylgeranyl transferase (Hancock, JF, et al., Cell 57:1167-1177 (1989)). Subsequently, the three C-terminal amino acids are cleaved (Gutierrez, L., et al., EMBO J. 8:1093-1098 (1989)), and the terminal Cys is converted to a methyl ester (Clark, S., et al., Proc. Nat'l Acad. Sci. (USA) 85:4643-4647 (1988)). Some forms of Ras are also reversibly palmitoylated on cysteine residues immediately N-terminal to Cys<sup>168</sup> (Buss, JE, et al., Mol. Cell. Biol. 6:116-122 (1986)). It is believed that these modifications increase the hydrophobicity of the C-terminal region of Ras, causing it to localize at the surface of the cell membrane. Localization of Ras to the cell membrane is necessary for signal transduction (Willumsen, BM, et al., Science 310:583-586 (1984)).

Oncogenic forms of Ras are observed in a relatively large number of cancers including over 50 percent of colon cancers and over 90 percent of pancreatic cancers (Bos, JL, Cancer Research 49:4682-4689 (1989)). These observations suggest that intervention in the function of Ras mediated signal transduction may be useful in the treatment of cancer.

Previously, it has been shown that the C-terminal tetrapeptide of Ras has the "CAAX" motif (wherein C is cysteine, A is an aliphatic amino acid, and X is any amino acid). Tetrapeptides having this structure have been shown to be inhibitors of prenyl transferases (Reiss, et al., Cell 62:81-88 (1990)). Poor potency of these early farnesyl transferase inhibitors has prompted the search for new inhibitors with more favorable pharmacokinetic behavior (James, GL, et al., Science 260:1937-1942

(1993); Kohl, NE, et al., Proc. Nat'l Acad. Sci. USA 91:9141-9145 (1994); deSolms, SJ, et al., J. Med. Chem. 38:3967-3971 (1995); Nagasu, T, et al., Cancer Research 55:5310-5314 (1995); Lerner, EC, et al., J. Biol. Chem. 270:26802-26806 (1995); Lerner, EC, et al., J. Biol. Chem. 270:26770 (1995); and James, et al., Proc. Natl. Acad. Sci. USA 93:4454 (1996)).

Recently, it has been shown that a prenyl transferase inhibitor can block growth of Ras-dependent tumors in nude mice (Kohl, NE, et al., Proc. Nat'l Acad. Sci. USA 91:9141-9145 (1994)). In addition, it has been shown that over 70 percent of a large sampling of tumor cell lines are inhibited by prenyl transferase inhibitors with selectivity over non-transformed epithelial cells (Sepp-Lorenzino, I, et al., Cancer Research, 55:5302-5309 (1995)). Inhibiting farnesylation has been disclosed as a method of treating hepatitis delta virus infection, (Casey, P, et al., WO 97/31641).

example, in general formula (I): ( ), as hereinabove defined, when  $R^{10}$  and  $R^7$  are taken together to form

, the following structure results:

Similarly in general formula (I), as hereinabove defined, when  $R^3$  and  $R^{11}$  are taken together to form

the following structure results:

- 5 When a line is drawn through a cyclic moiety, the line indicates that the substituent can be attached to the cyclic moiety at any of the available bonding

points. For example, means that the substituent "X" can be bonded ortho, meta or para to the point of attachment. Further, when a line is drawn

- 10 through a bi-cyclic or a tri-cyclic moiety, the line indicates that the substituent can be attached to the bi-cyclic or a tri-cyclic moiety at any of the available bonding points in any of the rings. Similarly, when an arrow is drawn through a cyclic moiety, the arrow indicates that the point of attachment of the cyclic moiety to the compound can occur at any of the available bonding points on the cyclic moiety.

Further, when an arrow is drawn through a bi-cyclic or a tri-cyclic moiety, the arrow indicates that the point of attachment of the bi-cyclic or a tri-cyclic moiety to the compound can occur at any of the available bonding points in any of the rings of the bi-cyclic or a tri-cyclic moiety.

5           Some of the compounds of the instant invention can have at least one asymmetric center. Additional asymmetric centers may be present on the molecule depending upon the nature of the various substituents on the molecule. Each such asymmetric center will produce two optical isomers and it is intended that all such optical isomers, as separated, pure or partially purified optical isomers, racemic  
10       mixtures or diastereomeric mixtures thereof, are included within the scope of the instant invention.

          The compounds of the instant invention generally can be isolated in the form of their pharmaceutically acceptable acid addition salts, such as the salts derived from using inorganic and organic acids. Examples of such acids are  
15       hydrochloric, nitric, sulfuric, phosphoric, formic, acetic, trifluoroacetic, propionic, maleic, succinic, D-tartaric, L-tartaric, malonic, methane sulfonic and the like. In addition, certain compounds containing an acidic function such as a carboxy can be isolated in the form of their inorganic salt in which the counter-ion can be selected from sodium, potassium, lithium, calcium, magnesium and the like, as well as from  
20       organic bases.

          The pharmaceutically acceptable salts can be formed by taking about 1 equivalent of a compound of formula (I) and contacting it with about 1 equivalent or more of the appropriate corresponding acid of the salt which is desired. Work-up and isolation of the resulting salt is well-known to those of ordinary skill in the  
25       art.

          The compounds of this invention can be administered by oral, parenteral (e.g., intramuscular, intraperitoneal, intravenous or subcutaneous injection, or implant), nasal, vaginal, rectal, sublingual or topical routes of administration and can be formulated with pharmaceutically acceptable carriers to provide dosage

forms appropriate for each route of administration. Accordingly, the present invention includes within its scope pharmaceutical compositions comprising, as an active ingredient, at least one of the compounds of formula (I) in association with a pharmaceutically acceptable carrier.

5           Solid dosage forms for oral administration include capsules, tablets, pills, powders and granules. In such solid dosage forms, the active compound is admixed with at least one inert pharmaceutically acceptable carrier such as sucrose, lactose, or starch. Such dosage forms can also comprise, as is normal practice, additional substances other than such inert diluents, e.g., lubricating agents such as  
10   magnesium stearate. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

          Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, the elixirs containing inert  
15   diluents commonly used in the art, such as water. Besides such inert diluents, compositions can also include adjuvants, such as wetting agents, emulsifying and suspending agents, and sweetening, flavoring and perfuming agents.

          Preparations according to this invention for parenteral administration include sterile aqueous or non-aqueous solutions, suspensions, or emulsions.  
20   Examples of non-aqueous solvents or vehicles are propylene glycol, polyethylene glycol, vegetable oils, such as olive oil and corn oil, gelatin, and injectable organic esters such as ethyl oleate. Such dosage forms may also contain adjuvants such as preserving, wetting, emulsifying, and dispersing agents. They may be sterilized by, for example, filtration through a bacteria-retaining filter, by incorporating  
25   sterilizing agents into the compositions, by irradiating the compositions, or by heating the compositions. They can also be manufactured in the form of sterile solid compositions which can be dissolved in sterile water, or some other sterile injectable medium immediately before use.

Compositions for rectal or vaginal administration are preferably suppositories which may contain, in addition to the active substance, excipients such as coca butter or a suppository wax.

5 Compositions for nasal or sublingual administration are also prepared with standard excipients well known in the art.

In general, an effective dosage of active ingredient in the compositions of this invention may be varied; however, it is necessary that the amount of the active ingredient be such that a suitable dosage form is obtained. The selected dosage depends upon the desired therapeutic effect, on the route of administration, and on  
10 the duration of the treatment, all of which are within the realm of knowledge of one of ordinary skill in the art. Generally, dosage levels of between 0.0001 to 100 mg/kg of body weight daily are administered to humans and other animals, e.g., mammals.

A preferred dosage range is 0.01 to 10.0 mg/kg of body weight daily,  
15 which can be administered as a single dose or divided into multiple doses.

Compounds of the instant invention can be and were assessed for activity on anchorage-dependent growth of human tumor cell lines according to the following assay.

Cells were seeded in a 96 well plate at day 0 and treated at day 1 for 96  
20 hours with the following concentrations of a compound of the present invention: 50, 25, 12.5, 6.25, 3.12, 1.56, 0.78, 0.39 and 0.00  $\mu$ M. At the end of this period, the quantification of cell proliferation is evaluated by colorimetric assay based on the cleavage of the tetrazolium salt WST1 by mitochondrial dehydrogenases in viable cells leading to the formazan formation. These experiments were twice  
25 repeated in octuplicates, thus allowing for the determination of a window of compound concentration including the  $IC_{50}$  value.

The protocol described immediately above was performed using the following human tumor cell lines: Prostate: DU145 adenocarcinoma, with WT ras, resistant to L744-832; Colon: HT29, adenocarcinoma with Wild Type ras (WT),

sensitive to L744-832; Pancreas: MIA PaCa-2, carcinoma with Ki-ras mutation; Lung: A427, carcinoma with Ki-ras mutation.

It is to be understood that while the invention has been described in conjunction with the detailed description thereof, that the foregoing description is intended to illustrate and not limit the scope of the invention, which is defined by the scope of the appended claims.

Step 40.a. (R,S) 4-(Hydroxy-(1-trityl-1H-imidazol-4-yl)-methyl)-benzonitrile

A solution of 1-trityl-4-iodoimidazole (3.53g, 8.10mmol) in  $\text{CH}_2\text{Cl}_2$  (35ml) was cooled to about  $-3^\circ\text{C}$  under  $\text{N}_2$  and 3M EtMgBr in  $\text{Et}_2\text{O}$  was added dropwise while maintaining reaction temperature at below about  $0^\circ\text{C}$ . The solution was stirred for about one hour at about  $0^\circ\text{C}$  and then 4-cyanobenzaldehyde (1.18g, 9.00mmol) was added in one portion and the reaction was allowed to warm to room temperature for about 1 hour. The reaction mixture was then again cooled to about  $0^\circ\text{C}$  and 5% HCl (30ml) was added. The reaction mixture was stirred about 15 min. and then extracted with  $\text{CH}_2\text{Cl}_2$  (2x25ml). The combined  $\text{CH}_2\text{Cl}_2$  layers were washed with saturated  $\text{NaHCO}_3$ , dried over  $\text{Na}_2\text{SO}_4$ , filtered, and then concentrated under reduced pressure. The residue was triturated with EtOAc (25ml) and the product filtered off (2.92g, 82%). Mass spec. 442.3  $\text{MH}^+$ , NMR (300MHZ,  $\text{DMSO-d}_6$ ,  $30^\circ\text{C}$ ) 7.7-7.8 (2H, d), 7.5-7.6 (2H, d), 7.3-7.5 (9H, m), 7.25-7.3 (1H, s), 7.0-7.15 (6H, m), 6.75-6.8 (1H, s), 5.9-6.90 (1H, m), 5.6-5.7 (1H, m).

Step 40.b. 4-((1H-imidazol-4-yl)-methyl)-benzonitrile

A solution of the product from Step 40.a. (1.10g, 2.49mmol) was treated with Tfa (15ml) and  $\text{Et}_3\text{SiH}$  (3.0ml, 18.8mmol). The mixture was heated at reflux for about 2 hours. The reaction mixture was then concentrated to remove by-products. Tfa (15ml) and  $\text{Et}_3\text{SiH}$  (3.0ml, 18.8mmol) were added and the mixture was refluxed for an additional about 2 hours and then concentrated. Fresh reagents were added and by-products were removed by evaporation under reduced pressure as required until the starting material was consumed. Consumption of starting material was monitored by analytical HPLC analysis using a VYDAC  $\text{C}_{18}$  column (The Nest Group, Southborough, MA) and a gradient of 0% to 70%  $\text{CH}_3\text{CN}$  / 0.1% Tfa over 25 minutes. The crude product was purified by preparative HPLC on a RAININ™  $\text{C}_{18}$  column using a gradient of 0% to 50%  $\text{CH}_3\text{CN}$  / 0.1% Tfa over 45

min. Product fractions were combined, concentrated to ½ volume and lyophilized to yield pure product. The product salt was made basic with saturated NaHCO<sub>3</sub> solution, extracted into CH<sub>2</sub>Cl<sub>2</sub> (3x25ml), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. Mass spec. 183.9 MH<sup>+</sup>, NMR (300MHZ, 5 CDCl<sub>3</sub>, 30°C) 7.55-7.6 (2H, d (j=8hz), 7.55-7.58 (1H, d (j=1hz)), 7.3-7.4 (2H, d(j=8hz)), 6.75-6.8 (1H, d (j=1hz)), 3.9-4.1 (2H, s).

Step 40.c. 4-((1-trityl-1H-imidazol-4-yl)-methyl)-benzonitrile

(152mg, 0.83mmol), chlorotriphenylmethane (231mg, 0.83mmol) and Et<sub>3</sub>N (139ul, 1.0mmol) were dissolved in THF (4ml) and 10 stirred under N<sub>2</sub> at room temperature for about 2 hours. A saturated solution of NaHCO<sub>3</sub> (5ml) was added and the product was extracted with EtOAc (2x20ml). The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated under reduced pressure. The crude was purified by crystallization from EtOAc and hexanes to yield pure product (285mg, 81%). Mass spec. 426.4 MH<sup>+</sup> (minor line), NMR 15 (300MHZ, CDCl<sub>3</sub>, 30°C) 7.5-7.6 (2H, d(j=8hz)), 7.4-7.45 (1H, d(j=1hz)), 7.3-7.4 (11H, m), 7.1-7.2 (6H, m), 6.58-6.62 (1H, d(j=1Hz)), 3.9-4.0 (2H, s).

methoxyphenyl)imidazo[1,2a][1,4] benzodiazepine

The product from Step 40.c. (108mg, 0.35mmol) was dissolved in DMF 20 (1.5ml) and Bromoacetyl bromide (65ul, 0.75mmol) was added at room temperature with stirring. The mixture was allowed to stand overnight and was then concentrated under reduced pressure to give crude product that was used in Step 40.e. without further purification. Mass spec. 430.2 432.2 MH<sup>+</sup>.

Step 40.e. (2-(5-((4-cyano)phenylmethyl)imidazol-1-yl)-1-oxoethyl-2,5-dihydro-8- 25 fluoro-4-(2-methoxyphenyl)imidazo[1,2c][1,4]-benzodiazepine

The product from Step 40.d. (0.32mmol) was distributed between saturated NaHCO<sub>3</sub> (2ml) and EtOAc (5ml). The aqueous layer was extracted again with EtOAc (5ml) and the EtOAc layers were combined, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated to about 2ml. The product from Step 40.c. (134mg, 0.32mmol) was

added and the mixture was stirred at room temperature for about 2 days and then concentrated under reduced pressure. The residue was taken up in methanol (4ml) and heated at reflux for about 1 hour. The reaction was cooled and concentrated under reduced pressure and the crude product was purified by preparative HPLC on a RAININ™ C<sub>18</sub> column using a gradient of 0% to 50% CH<sub>3</sub>CN / 0.1% Tfa over 45 min.. Product fractions were combined and concentrated under reduced pressure. The Tfa salt was converted to the hydrochloride salt by passing a 30% methanolic solution through an ion exchange column (BioRad AG 1-X2, 200-400 mesh, 0.6 meq/ml, 100 ml, chloride form). The product fractions were combined, concentrated to a volume of about 10 ml and lyophilized from H<sub>2</sub>O to yield pure product (35 mg, 18%) as the di-hydrochloride. ## Continuation of Box I.2

Present claims 1 to 7 and 15 to 18 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds/claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds of formula I where R4 is an optionally substituted phenyl as claimed in claims 8 to 14 and 19 and as described in examples 1 to 40.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
